

IN THE CLAIMS

Claims 1-10 are pending in this application.

1. (Previously Presented) Method for bitrate control in a video or audio encoder having an encoded-data buffer, including the steps:

using a first control signal representing the current filling level of said encoded-data buffer to control the video or audio encoder output bitrate by corresponding adaptation of at least one encoding parameter used in said video or audio encoder;

passing the encoded video or audio data through said encoded-data buffer and through a downstream input buffer of a data recorder for storage on a storage medium operated in said data recorder, wherein said encoded video or audio data, after passing through said encoded-data buffer, pass through said input buffer together with data from at least one other encoded data stream before being recorded on said storage medium, thereby controlling said at least one encoding parameter additionally by a second control signal representing the current filling level of said input buffer of said data recorder in order to avoid overflow and underflow of said input buffer.

2. (Original) Method according to claim 1, wherein said video or audio encoder is an MPEG encoder, in particular MPEG-2 video.

3. (Original) Method according to claim 1, wherein said data recorder is a DVD recorder.

4. (Previously Presented) Method according to claim 1, wherein said video or audio encoder has in its encoding loop a quantizer and said encoding parameter is the characteristic of said quantizer and, if present, of an inverse quantizer.

5. (Previously Presented) Method according to claim 1, wherein the data stream input to said video or audio encoder is an MPEG data stream and includes data - e.g. EPG data - concerning the temporal length or data concerning the amount of data for a program to be recorded, from which data, based on the initial or currently remaining program length and a desired average data rate, and based on the initial or currently remaining program length and a desired average data rate, and based on the initial or currently remaining storage capacity for this program on said storage medium, said at least one encoding parameter is additionally controlled.

6. (Previously Presented) Apparatus for bitrate control, including:
a video or audio encoder to which an encoded-data buffer is assigned;
a data recorder including an input buffer, wherein output video or audio data of said encoded-data buffer pass through said input buffer together with data from at least one other encoded data stream and are thereafter stored on a storage medium operated in said data recorder,

and wherein a first control signal representing the current filling level of said encoded-data buffer is used to control the video or audio encoder output bitrate by corresponding adaptation of at least one encoding parameter used in said video or audio encoder, and

wherein said at least one encoding parameter is additionally controlled by a second control signal representing the current filling level of said input buffer of said data recorder in order to avoid overflow and underflow of said input buffer.

7. (Original) Apparatus according to claim 6, wherein said video or audio encoder is an MPEG encoder, in particular MPEG-2.

8. (Original) Apparatus according to claim 6, wherein said data recorder is a DVD recorder.

9. (Previously Presented) Apparatus according to claim 6, wherein said video or audio encoder ~~has~~ comprises in its encoding loop a quantizer and said

encoding parameter is the characteristic of said quantizer and, if present, an inverse quantizer.

10. (Previously Presented) Apparatus according to claim 6, wherein the data stream input to said video or audio encoder is an MPEG data stream and includes data - e.g. EPG data - concerning the temporal length or data concerning the amount of data for a program to be recorded, from which data, based on the initial or currently remaining program length and a desired average data rate, and based on the initial or currently remaining storage capacity for this program on said storage medium, the at least one encoding parameter is additionally controlled.
